**Ask me about:** Optimizing medication and vaccine use among older adults, health services research in long-term care settings, pharmacoepidemiology and patient-centered outcomes research

Andrew R. Zullo, PharmD, PhD focuses on improving medication and vaccine use for older adults. In particular, he aims to optimize medication and vaccine use for the outcomes of greatest importance to older adults, such as physical and cognitive function. To that end, Andrew conducts research in geriatric pharmacoepidemiology and health services research. He specializes in studying the functional outcomes of medication use in institutional post-acute care and long-term care. He often applies

pharmacoepidemiologic, comparative effectiveness and safety, and causal inference methodologies to large administrative claims, electronic health record, and other linked datasets that provide information on older adults. Andrew's work occasionally also includes medication-related evidence synthesis projects.

## THRIVE Goals

---

Impact Goal 1: LTSS Quality, Safety, and Value

Research Area: Geriatric Mental Health

Emerging Area: Pharmacy

## Research

---

Pharmacoepidemiology	Real-world evidence
Long-term care	Post-acute care
Drug-drug interactions
